MATH 553 - MATHEMATICAL MODELS, FALL 2014

TOM DELILLO, INSTRUCTOR

- Time: 4:00-5:15 TTh, JB 335
- Contact info.: office: JB 046, 978-5224 (office), 264-7806 (home)
- email: delillo@math.wichita.edu
- webpage: http://www.math.wichita.edu/~delillo/ (Some additional course info. and MATLAB code will be available here.)
- Office hours: 1:00-2:00 TTh, JB 046, or by appointment

**Prerequisite:** Math 344 with C or better or departmental consent.

**Objectives:** To learn some mathematics in the context of specific applications, this semester to simple models of parts of the earth’s climate system, to see how such models may elucidate more complex phenomena, and to formulate a problem or project of mathematical interest related to climate and present your results in a clear and professional manner. Use of computational tools such as MATLAB will be encouraged.

As we all know, some of the predictions of climate science in recent decades point to severe problems for human civilization in the next centuries or even decades, if they are not addressed properly, that is, if we don’t severely cut down on our burning of fossil fuels. This would require a major restructuring of how the world’s energy is supplied and has led to some intense debates over politics, economics, and technology. It is not the purpose of this course to address these serious issues, though they will inevitably arise in readings, discussions, or seminars. Indeed, although climate and weather are interesting scientific disciplines in their own right, this interest is surely now magnified by concern for the environment. I hope that all this gives us more motivation to understand the course material and has the fringe benefit of deepening our understanding of what the climate science is telling us.

**Additional reference books:**

Cleve Moler *Numerical Computing with MATLAB*, SIAM 2004, available online. Your warm-up project will be Problem 7.21 from Chapter 7 of this book. (More details later.) This is our Math 551 text usually. For a link the for a link to this and other MATLAB code, go to my Math 551 course on my webpage. Cahters and code can be also be downloaded from http://www.mathworks.com/moler/chapters.html

I put the following books on reserve in out library:

A copy of text, Kaper and Engler.

Here are some other books of interest:

David Archer and Raymond Pierrehumbert, eds., *The Warming Papers: The Scientific Foundation for the Climate Change Forcast*, Wiley-Blackwell, 2011. A collection of original papers including the 1824 paper by Joseph Fourier first discussing the greenhouse effect and the 1896 paper by Svante Arrhenius with the first estimate of climate sensitivity—how much warming would result from doubling the CO$_2$ content of the atmosphere. The 1968 papers by Budyko and Sellers on energy balance models are also here.

Joseph Pedlosky, *Geophysical Fluid Dynamics*, 1987. This is the classical reference on the fluid dynamics (partial differential equations) of the atmosphere and oceans. It is probably beyond the scope of this course, but may be useful if we do material in Chap 15 of our text.

**Speakers of interest in Fall 2013 Physics Seminar, Wed. 2-3PM, JB 128.**

Most talks were posted on the Physics groups website [http://webs.wichita.edu/?u=MATHSCI&p=/physics/events/index/](http://webs.wichita.edu/?u=MATHSCI&p=/physics/events/index/)

The following are of particular interest:

David Archer, U. Chicago, Sept. 11, 2013; see Moler prob. 7.21

Hans Kaper, Georgetown, Oct. 2

Edwin Gerber, Courant CAOS group, Oct. 9

Jerry Peterson, U CO Boulder, Oct 30.

Kevin Trenberth, NCAR Boulder, Nov 14

plus some local speakers.

See also some online talks posted on Mathematics of Planet Earth 2013 [http://mpe2013.org/](http://mpe2013.org/)

### Grading (approximate) points

<table>
<thead>
<tr>
<th>Activity</th>
<th>Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>Homework—keep problem notebook.</td>
<td>100</td>
</tr>
<tr>
<td>Exam on mathematical techniques (around 10/16, after Fall break).</td>
<td>100</td>
</tr>
<tr>
<td>(Drop lowest of Homework and Exam.)</td>
<td></td>
</tr>
<tr>
<td>Warm-up project: Prob. 7.21 from Moler’s NCM Math 551 book</td>
<td>100</td>
</tr>
<tr>
<td>due Oct. 9 before Fall break.</td>
<td></td>
</tr>
<tr>
<td>About 5 meeings with me to determine projects, 5 × 20 = 100</td>
<td>100</td>
</tr>
<tr>
<td>Project presentation/poster (times tbd before final, more details below).</td>
<td>50</td>
</tr>
<tr>
<td>Project final report due 12/11.</td>
<td>150</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>500</strong></td>
</tr>
</tbody>
</table>

**Grading scale:** I do not have a fixed grade scale. I usually end up curving final raw scores to your favor. I will assign grades in a reasonable manner and inform you of how you are doing relative to the rest of the class after each exam or project. The rule for converting final grades into your GPA is fixed by WSU and you can look it up.

**Attendance policy, etc.:** Regular attendance is mandatory. I will pass around an attendance sheet during each class. Good attendance will count in your favor, if your grade is borderline. Part of the purpose of this course is to get you to talk with me and your fellow students about mathematics. I will arrange individual and team meetings in my office after the course is underway.

If you fall behind or have other problems with the class, please contact me as soon as possible. Turning in homework late, missing class, or missing exams for any reason is highly discouraged. I will try to be helpful if you have special difficulties. **If you miss an excessive number of classes, you may fail the course or your grade may be lowered.**

**Important dates:**

- First day of classes 8/18.
- Fall break: 10/11–10/14.
- Last day to drop with a “W”: 10/28.
- Last day of classes: 12/4.
- Final exam/project reports: Thursday 12/11, 3:00–4:50 PM, in classroom.

**Definition of a Credit Hour:** 3 credit hour class: Success in this 3 credit hour course is based on the expectation that students will spend, for each unit of credit, a minimum of 45 hours over the length of the course (normally 3 hours per unit per week with 1 of the hours used for lecture) for instruction and preparation/studying or course related activities for a total of 135 hours.
### Syllabus

<table>
<thead>
<tr>
<th>week</th>
<th>Planned Topics (approximate, subject to revision)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Chap 1, Intro, overview, start thermo and greenhouse effect</td>
</tr>
<tr>
<td>2</td>
<td>Chap 2, Earth's energy budget, energy balance models</td>
</tr>
<tr>
<td>3</td>
<td>Chap 3, Oceans and climate, box models</td>
</tr>
<tr>
<td>4</td>
<td>Chap 4, Dynamical systems, ODE review</td>
</tr>
<tr>
<td>5</td>
<td>&quot;&quot;</td>
</tr>
<tr>
<td>6</td>
<td>Chap 5 Bifurcation theory</td>
</tr>
<tr>
<td>7</td>
<td>&quot;&quot;</td>
</tr>
<tr>
<td>8</td>
<td>Chap 6, Stommel's box model</td>
</tr>
<tr>
<td>9</td>
<td>Exam on math, esp. Chaps 4,5 on 10/16</td>
</tr>
<tr>
<td>10</td>
<td>Chap 7, Lorenz equations</td>
</tr>
<tr>
<td>11–16</td>
<td>Chaps 11—15 or material to be determined by interests/projects</td>
</tr>
</tbody>
</table>

#### Possible topics and references for team projects and reports

We will discuss possible projects when we meet. One source may be material from the text that we don’t cover in class. You may work individually or in teams. Teams should consist of at most two or three students and the final report should be longer. The papers and books listed here are available from me or from journals in the library and are possible bases for projects. In addition, groups of related problems or chapters from the text not covered in class may also serve as bases of projects. Reproduction or extension of computational results from the papers is highly encouraged. I will arrange meetings with your teams. We will try to decide on a topic around the time of Fall break. A brief presentation (preferably using power point or latex beamer) and a typed, referenced, final report (preferably using latex) will be due at the end of the semester. Making and presenting a poster may be an alternative to a presentation. More details will be worked out later.

The website [MPE] and some of the links below contain a great number of links to videos and interesting material to give you specific ideas for projects and also a broader context for the material in the course.

**Note carefully:** It is absolutely essential that you reference and give proper credit to any sources that you use. If you collaborate or have helpful discussions with someone, that too should generally be acknowledged.
