

Chapter 6: Integration Techniques

6.1: "The Amazing" Integration by Parts

We don't know how to integrate this: $\int_a^b f(x) g(x) dx$.

Let's find out how...

Let $f(x)$ and $g(x)$ be differentiable functions

Recall the product rule:

$$\frac{d}{dx} [f(x) g(x)] = \frac{d}{dx} [f(x)] g(x) + f(x) \frac{d}{dx} [g(x)]$$

Integrate it all wrt x :

$$\int \frac{d}{dx} [f(x) g(x)] dx = \int \frac{d}{dx} [f(x)] g(x) dx + \int f(x) \frac{d}{dx} [g(x)] dx$$

LHS: F.T.C. says $\int \frac{d}{dx} [\text{---}] dx = \text{---}$

$$f(x) g(x) = \int \frac{d}{dx} [f(x)] g(x) dx + \int f(x) \frac{d}{dx} [g(x)] dx$$

Rearrange:

$$\boxed{\int \frac{d}{dx} [f(x)] g(x) dx = f(x) g(x) - \int f(x) \frac{d}{dx} [g(x)] dx}$$

This is the integration by parts formula.

It says that we can "move the derivative from f to g ".

The idea is to "get rid of g " by taking its deriv.

$$\underline{\text{Ex.}} \quad \int x \sin x dx = -x \cos x - \int -\cos x (1) dx$$

$$\left. \begin{array}{l} \frac{d}{dx} [f(x)] = \sin x \\ f(x) = -\cos x \end{array} \right\} \begin{array}{l} g(x) = x \\ \frac{d}{dx} [g(x)] = 1 \end{array} \quad \begin{array}{l} = -x \cos x + \int \cos x dx \\ = \boxed{-x \cos x + \sin x + C} \end{array}$$

$$\begin{aligned} \underline{\text{Ex.}} \quad \int \ln x \, dx &= \int \ln x \cdot 1 \, dx = x \ln(x) - \int x \cdot \frac{1}{x} \, dx \\ &= x \ln x - \int 1 \, dx \\ &= \boxed{x \ln x - x + C} \end{aligned}$$

$$\begin{aligned} \frac{d}{dx}[f(x)] &= 1 & g(x) &= \ln(x) \\ f(x) &= x & \frac{d}{dx}[g(x)] &= \frac{1}{x} \end{aligned}$$

$$\underline{\text{Ex.}} \quad \int t^2 e^t \, dt$$

$$\begin{aligned} \frac{d}{dt}[f(t)] &= e^t & g(t) &= t^2 \\ f(t) &= e^t & \frac{d}{dt}[g(t)] &= 2t \end{aligned}$$

$$= t^2 e^t - \underbrace{\int 2t e^t \, dt}$$

$$\begin{aligned} \frac{d}{dt}[f(t)] &= e^t & g(t) &= 2t \\ f(t) &= e^t & \frac{d}{dt}[g(t)] &= 2 \end{aligned}$$

$$= t^2 e^t - 2t e^t + \int 2e^t \, dt$$

$$= \boxed{t^2 e^t - 2t e^t + 2e^t + C}$$

(*) make a chart.

$$\begin{aligned} \underline{\text{Ex.}} \quad \int e^x \sin x \, dx &= e^x \sin x - \int e^x \cos x \, dx \\ &= e^x \sin x - e^x \cos x - \int e^x \sin x \, dx \end{aligned}$$

$$\Rightarrow 2 \int e^x \sin x \, dx = e^x \sin x - e^x \cos x$$

$$\Rightarrow \int e^x \sin x \, dx = \boxed{\frac{1}{2} e^x (\sin x - \cos x) + C}$$

A few more Int. by Parts examples.

Ex. $\int \theta \sec^2 \theta d\theta$

$$u = \theta \quad dv = \sec^2 \theta d\theta$$

$$du = 1 d\theta \quad v = \tan \theta$$

$$\Rightarrow \int \theta \sec^2 \theta = \theta \tan \theta - \int \tan \theta d\theta$$

$$= \theta \tan \theta - \int \frac{\sin \theta}{\cos \theta} d\theta \quad \leftarrow \begin{array}{l} y = \cos \theta \\ dy = -\sin \theta d\theta \end{array}$$

$$= \theta \tan \theta + \int \frac{1}{y} dy$$

$$= \theta \tan \theta + \ln |y| + C$$

$$= \theta \tan \theta + \ln |\cos \theta| + C$$

$$= \boxed{\theta \tan \theta - \ln |\sec \theta| + C}$$

How to choose u:

- L log
- I inv. trig.
- A alg. (polynomial)
- T trig
- E exponential

Ex. A trick:

$$\int x^4 e^{2x} dx$$

+	$\frac{u}{x^4}$	$\frac{dv}{e^x}$
-	$4x^3$	e^x
+	$12x^2$	e^x
-	$24x$	e^x
	24	e^x
-	0	e^x

$$e^x [x^4 - 4x^3 + 12x^2 - 24x + 24] + C$$

Ex. $\int 5x^3 \sin(5x) dx$

$\frac{u}{+ 5x^3}$	$\frac{dv}{\sin 5x}$
$- 15x^2$	$-\frac{1}{5} \cos 5x$
$+ 30x$	$-\frac{1}{25} \sin 5x$
$- 30$	$\frac{1}{125} \cos 5x$
0	$\frac{1}{525} \sin 5x$

+ C

6.2. Trig Integrals

$$\begin{aligned}\text{Ex. } \int \cos^3 x \, dx &= \int \cos^2 x \cos x \, dx \\&= \int (1 - \sin^2 x) \cos x \, dx \\&\quad u = \sin x \quad du = \cos x \, dx \\&= \int 1 - u^2 \, du \\&= u - \frac{1}{3} u^3 + C \\&= \boxed{\sin x - \frac{1}{3} \sin^3 x + C}\end{aligned}$$

$$\begin{aligned}\text{Ex. } \int \sin^5 x \cos^2 x \, dx &= \int \sin^4 x \cos^2 x \sin x \, dx \\&= \int (1 - \cos^2 x)^2 \cos^2 x \sin x \, dx \\&\quad u = \cos x \quad du = -\sin x \, dx \\&= - \int (1 - u^2)^2 u^2 \, du \\&= - \int u^2 (1 - 2u^2 + u^4) \, du \\&= - \int u^2 - 2u^4 + u^6 \, du \\&= -\frac{1}{3} u^3 + \frac{2}{5} u^5 - \frac{1}{7} u^7 + C \\&= \boxed{-\frac{1}{3} \cos^3 x + \frac{2}{5} \cos^5 x - \frac{1}{7} \cos^7 x + C}\end{aligned}$$

$$\begin{aligned}\text{Ex. } \int_0^{\pi} \sin^2 x \, dx &\quad \sin^2 x = \frac{1}{2} (1 - \cos 2x) \quad \cos^2 x = \frac{1}{2} (1 + \cos 2x) \\&= \frac{1}{2} \int_0^{\pi} (1 - \cos 2x) \, dx \\&= \left[\frac{1}{2} x - \frac{1}{4} \sin 2x \right]_0^{\pi} = \frac{1}{2} \pi - 0 = \boxed{\frac{1}{2} \pi}\end{aligned}$$

Ex. $\int \sin^4 x \, dx$

Ex. $\int \tan^6 x \sec^4 x \, dx$ $\sec^2 x$

Ex. $\int \tan^5 \theta \sec^7 \theta \, d\theta$ $\tan \theta \sec \theta \, d\theta$

recall: $\int \sec x \, dx = \ln |\sec x + \tan x| + C$

trick: mult by $\frac{\sec x + \tan x}{\sec x + \tan x}$

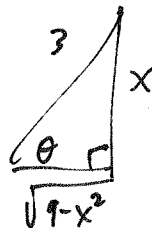

Main idea: these suck, but we can do them.
leads to trig substitutions.

Ex. $\int \frac{\sqrt{9-x^2}}{x^2} \, dx$

let $x = 3 \sin \theta \rightarrow \sin \theta = \frac{x}{3}$
 $dx = 3 \cos \theta \, d\theta$

$\rightarrow \int \frac{\sqrt{9-9\sin^2 \theta}}{9\sin^2 \theta} 3 \cos \theta \, d\theta$

$= \int \frac{3 \cos \theta \cdot 3 \cos \theta}{9 \sin^2 \theta} \, d\theta$

$= \int \cot^2 \theta \, d\theta = \int (\csc^2 \theta - 1) \, d\theta = -\cot \theta - \theta + C$

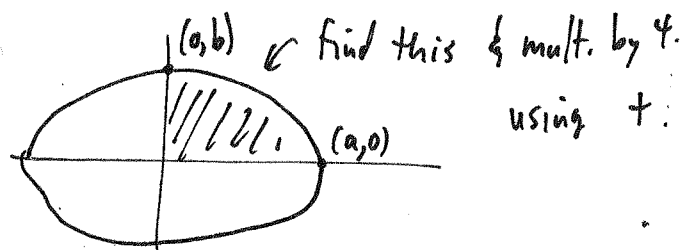

$= \ln |\sec \theta| + C = \ln \left| \frac{3}{\sqrt{9-x^2}} \right| + C$

$= \ln 3 - \ln \sqrt{9-x^2} + C$

$= -\frac{\sqrt{9-x^2}}{x} - \arcsin\left(\frac{x}{3}\right) + C$

8/31/12

Ex. Find the area enclosed by the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

$$\frac{y^2}{b^2} = 1 - \frac{x^2}{a^2} = \frac{a^2 - x^2}{a^2}$$

$$y^2 = \frac{b^2}{a^2} (a^2 - x^2)$$

$$y = \pm \frac{b}{a} \sqrt{a^2 - x^2}$$

$$\frac{1}{4} A = \int_0^a \frac{b}{a} \sqrt{a^2 - x^2} dx$$

$$\text{let } x = a \sin \theta$$

$$dx = a \cos \theta d\theta$$

$$= \frac{b}{a} \int_0^{\pi/2} \sqrt{a^2 - a^2 \sin^2 \theta} a \cos \theta d\theta$$

$$= \frac{b}{a} \int_0^{\pi/2} a^2 \cos^2 \theta d\theta$$

$$= \frac{ba}{2} \int_0^{\pi/2} 1 + \cos 2\theta d\theta$$

$$= \frac{ba}{2} \left[\theta + \frac{1}{2} \sin 2\theta \right]_0^{\pi/2} = \frac{ba}{2} \cdot \frac{\pi}{2} - 0 = \frac{ab\pi}{4}$$

$$\Rightarrow A = 4 \left(\frac{1}{4} \right) ab\pi = \boxed{ab\pi}$$

→ First Ex. (60) $\int \frac{dt}{\sqrt{t^2 - 6t + 13}}$ evaluate by first completing the square.

$$= \int \frac{dt}{\sqrt{(t-3)^2 + 4}}$$

$$\text{let } x = t-3 \\ dx = dt$$

$$= \int \frac{dx}{\sqrt{x^2 + 4}}$$

$$\text{let } x = 2 \tan \theta \\ dx = 2 \sec^2 \theta d\theta$$

Solve for these w/
a Δ .

$$= \int \frac{2 \sec^2 \theta}{2 \sec \theta} d\theta = \int \sec \theta d\theta = \ln |\sec \theta + \tan \theta| + C$$

6.3. Partial Fractions

Ex. $\int \frac{x+5}{x^2+x-2} dx$

$$x^2+x-2 = (x+2)(x-1)$$

$$\text{So, } \frac{x+5}{x^2+x-2} = \frac{A}{x+2} + \frac{B}{x-1}$$

$$\text{or } x+5 = A(x-1) + B(x+2)$$

$$x=1: 6 = 3B, B=2$$

$$x=-2: 3 = -3A, A=-1$$

$$\text{and } \frac{x+5}{x^2+x-2} = \frac{-1}{x+2} + \frac{2}{x-1}$$

$$\begin{aligned} \text{Then } \int \frac{x+5}{x^2+x-2} dx &= \int \frac{-1}{x+2} dx + \int \frac{2}{x-1} dx = -\ln|x+2| + 2\ln|x-1| + C \\ &= \boxed{\ln \left| \frac{(x-1)^2}{x+2} \right| + C} \end{aligned}$$

Ex. $\int \frac{x^3+x}{x-1} dx$

$$x-1 \overline{) \begin{array}{r} x^3 + 0x^2 + x + 0 \\ \underline{x^3} - x \end{array}}$$

$$= \int x^2 + 2 + \frac{2}{x-1} dx$$

$$= \boxed{\frac{1}{3}x^3 + 2x + 2\ln|x-1| + C}$$

$$\begin{array}{r} 2x \\ \underline{2x - 2} \\ 2 \end{array}$$

Ex. $\int \frac{x^2 + 2x - 1}{2x^3 + 3x^2 - 2x} dx$

$$\begin{aligned} 2x^3 + 3x^2 - 2x &= x(2x^2 + 3x - 2) \\ &= x(2x^2 + 4x - x - 2) \\ &= x[2x(x+2) - (x+2)] \\ &= x(2x-1)(x+2) \end{aligned}$$

$$\frac{x^2 + 2x - 1}{2x^3 + 3x^2 - 2x} = \frac{A}{x} + \frac{B}{2x-1} + \frac{C}{x+2}$$

$$x^2 + 2x - 1 = A(2x-1)(x+2) + B(x)(x+2) + C(x)(2x-1)$$

$$x=0: -1 = A(-1)(2) \quad A = \frac{1}{2}$$

$$\begin{aligned} x=\frac{1}{2}: \quad \frac{1}{4} + 1 - 1 &= B\left(\frac{1}{2}\right)\left(\frac{5}{2}\right) \\ \frac{1}{4} &= \frac{5B}{4} \quad B = \frac{1}{5} \end{aligned}$$

$$\begin{aligned} x=-2: \quad 4 - 4 - 1 &= C(-2)(-5) \\ -1 &= 10C \quad C = -\frac{1}{10} \end{aligned}$$

$$\int \frac{x^2 + 2x - 1}{2x^3 + 3x^2 - 2x} dx = \frac{1}{2} \int \frac{1}{x} dx + \frac{1}{5} \int \frac{1}{2x-1} dx - \frac{1}{10} \int \frac{1}{x+2} dx$$

$$= \left[\frac{1}{2} \ln|x| + \frac{1}{5} \ln|2x-1| - \frac{1}{10} \ln|x+2| + C \right]$$

Ex. $\int \frac{2x^2 - x + 4}{x^3 + 4x} dx$

* Irreducible quadratic factors.

$$x^3 + 4x = x(x^2 + 4)$$

$$\frac{2x^2 - x + 4}{x^3 + 4x} = \frac{A}{x} + \frac{Bx + C}{x^2 + 4}$$

$$2x^2 - x + 4 = A(x^2 + 4) + (Bx + C)x$$

$$2x^2 - x + 4 = Ax^2 + 4A + Bx^2 + Cx$$

$$x^2: 2 = A + B \quad B = 1$$

$$x: -1 = C$$

$$\#: 4 = 4A \quad A = 1$$

$$\text{so } \int \frac{2x^2 - x + 4}{x^3 + 4x} dx = \int \frac{1}{x} dx + \int \frac{x - 1}{x^2 + 4} dx \quad // \text{ 9/5/12}$$

$$= \int \frac{1}{x} dx + \frac{1}{2} \int \frac{2x}{x^2 + 4} dx - \int \frac{1}{x^2 + 4} dx$$

$$= \boxed{\ln|x| + \frac{1}{2} \ln|x^2 + 4| - \frac{1}{2} \arctan\left(\frac{x}{2}\right) + C}$$

Ex. $\int \frac{x^4 + 1}{x(x^2 + 1)^2} dx$

* repeated factors

$$\frac{x^4 + 1}{x(x^2 + 1)^2} = \frac{A}{x} + \frac{Bx + C}{x^2 + 1} + \frac{Dx + E}{(x^2 + 1)^2}$$

$$x^4 + 1 = A(x^2 + 1)^2 + (Bx + C)x(x^2 + 1) + (Dx + E)x$$

$$= A(x^4 + 2x^2 + 1) + x(Bx^3 + Cx^2 + Bx + C) + Dx^2 + Ex$$

$$= Ax^4 + 2Ax^2 + A + Bx^4 + Cx^3 + Bx^2 + Cx + Dx^2 + Ex$$

$$= x^4(A + B) + x^3(C) + x^2(2A + B + D) + x(C + E) + (A)$$

$$A+B=1$$

$$C=0$$

$$2A+B+D=0$$

$$C+E=0$$

$$A=1$$

$$A=1$$

$$C=E=B=0$$

$$D=-2$$

$$\frac{1}{x} - \frac{2x}{(x^2+1)^2}$$

$$= \frac{x^4 + 2x^2 + 1 - 2x^2}{x(x^2+1)^2} = \frac{x^4 + 1}{x(x^2+1)^2}$$

$$\text{So, } \int \frac{x^4+1}{x(x^2+1)^2} dx = \int \frac{1}{x} dx + \int \frac{-2x}{(x^2+1)^2} dx = \boxed{\ln|x| + \frac{1}{x^2+1} + C}$$

$$u = x^2 + 1$$

$$du = 2x dx$$

6.4 : Project only. Using WolframAlpha, calculators, and charts (in back of book) to help integrate. For example:

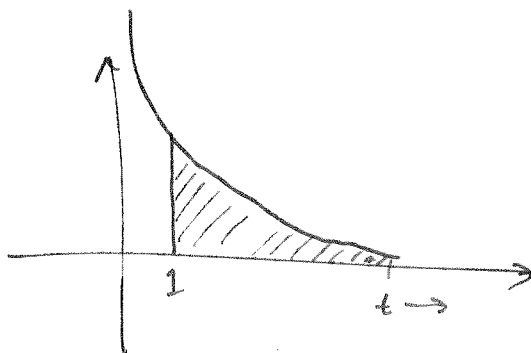

$$17. \int \frac{du}{a^2+u^2} = \frac{1}{a} \arctan\left(\frac{u}{a}\right) + C$$

$$\text{So, } \int \frac{dx}{x^2+2x+10} = \int \frac{dx}{(x+1)^2+3^2} = \boxed{\frac{1}{3} \arctan\left(\frac{x+1}{3}\right) + C}$$

6.6 Improper Integrals

Case I. ~~Improper~~ Integrals involving ∞ .

Ex. $y = \frac{1}{x^2}$

For any $t > 1$ we can calculate $\int_1^t \frac{1}{x^2} dx = \left[-\frac{1}{x} \right]_1^t = \frac{1}{1} - \frac{1}{t}$

Reasonable conjecture: $\int_1^{\infty} \frac{1}{x^2} dx = \lim_{t \rightarrow \infty} \int_1^t \frac{1}{x^2} dx$

$$\text{so } \int_1^{\infty} \frac{1}{x^2} dx = \lim_{t \rightarrow \infty} \left(1 - \frac{1}{t} \right) = 1 - 0 = \boxed{1}$$

Def'n. If $\int_a^t f(x) dx$ exist for all $t \geq a$, then

$$\int_a^{\infty} f(x) dx = \lim_{t \rightarrow \infty} \int_a^t f(x) dx \quad \text{provided the limit exists.}$$

If $\int_t^b f(x) dx$ exists for all $t \leq b$, then

$$\int_{-\infty}^b f(x) dx = \lim_{t \rightarrow -\infty} \int_t^b f(x) dx \quad \text{iff it exists.}$$

If these limits exist, then the integrals are said to be convergent, if not they are called divergent.

Ex. $\int_1^{\infty} \frac{1}{x} dx$

$$= \lim_{t \rightarrow \infty} \int_1^t \frac{1}{x} dx = \lim_{t \rightarrow \infty} (\ln x \Big|_1^t) = \lim_{t \rightarrow \infty} (\ln t - \ln 1)$$

$$= \lim_{t \rightarrow \infty} \ln t - \lim_{t \rightarrow \infty} \ln 1$$

$$= \infty - 0 = \infty$$

so the integral diverges.

Thus $\int_1^{\infty} \frac{1}{x^2} dx$ converges (=1), but $\int_1^{\infty} \frac{1}{x} dx$ diverges.

- Draw a picture.

Exc. $\int_1^{\infty} \frac{1}{x^n} dx$ Find out for what n this integral will converge.
(Exmpl 4 in book)

Ex. $\int_{-\infty}^0 x e^x dx = \lim_{t \rightarrow -\infty} \int_t^0 x e^x dx = \lim_{t \rightarrow -\infty} (x e^x - e^x \Big|_t^0)$

$$= \lim_{t \rightarrow -\infty} (0 - t e^t - 1 + e^t)$$

$$= - \lim_{t \rightarrow -\infty} t e^t - 1 + \underbrace{\lim_{t \rightarrow -\infty} e^t}_0$$

$$\lim_{t \rightarrow -\infty} t e^t = \lim_{t \rightarrow -\infty} \frac{t}{e^{-t}} \stackrel{L'H}{=} \lim_{t \rightarrow -\infty} \frac{1}{-e^{-t}} = \frac{1}{-\infty} = 0$$

so, $\int_{-\infty}^0 x e^x dx = \boxed{-1}$ converges.

Ex. $\int_{-\infty}^{\infty} \frac{1}{1+x^2} dx$

what to do w/ this?

Exc. RE #51 show that ~~that~~ ~~the~~ If $f(x)$ is odd, then $\int_{-t}^t f(x) dx = 0$ for all t . There is no reason that every odd function should converge. e.g. $f(x)=x$.

Defn. If both $\int_a^{\infty} f(x) dx$ and $\int_{-\infty}^a f(x) dx$ are convergent, then we define

$$\int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^a f(x) dx + \int_a^{\infty} f(x) dx$$

i.e. $\int_{-\infty}^{\infty} f(x) dx$ converges iff it converges to both $\pm \infty$.

Ex. $\int_{-\infty}^{\infty} \frac{1}{1+x^2} dx = \int_{-\infty}^0 \frac{1}{1+x^2} dx + \int_0^{\infty} \frac{1}{1+x^2} dx$

$$= \lim_{t \rightarrow -\infty} \int_t^0 \frac{1}{1+x^2} dx + \lim_{s \rightarrow \infty} \int_0^s \frac{1}{1+x^2} dx$$

$$= \lim_{t \rightarrow -\infty} \left(\arctan x \Big|_t^0 \right) + \lim_{s \rightarrow \infty} \left(\arctan x \Big|_0^s \right)$$

$$= \arctan 0 - \lim_{t \rightarrow -\infty} \arctan t + \lim_{s \rightarrow \infty} \arctan s - \arctan 0$$

$$= 0 - \left(-\frac{\pi}{2} \right) + \left(\frac{\pi}{2} \right) - 0 = \frac{\pi}{2} + \frac{\pi}{2} = \boxed{\pi} \quad \text{converges.} \quad // \quad 9/7/12$$

Project 2: §6.4

4.(a) $\int x e^x dx = e^x (x-1) + C$

Using
Wolfram

$$\int x^2 e^x dx = e^x (x^2 - 2x + 2) + C$$

$$\int x^3 e^x dx = e^x (x^3 - 3x^2 + 6x - 6) + C$$

(c) Conjecture:

$$\int x^n e^x dx = e^x \left(x^n - \frac{d}{dx}(x^n) + \frac{d^2}{dx^2}(x^n) - + \dots - \frac{d^n}{dx^n}(x^n) \right) + C$$

$$\text{where } \frac{d^n}{dx^n}(x^n) = n(n-1)(n-2)\dots 1 = n!$$

Math. induction:

1. initial case: $n=1$: $\int x e^x dx = e^x (x-1) + C = e^x \left(x - \frac{d}{dx}(x) \right) + C \quad \checkmark$

2. induction hypothesis: assume conjecture holds for some $n \geq 1$.

3. Prove for $n+1$:

$$\int x^{n+1} e^x dx = x^{n+1} e^x - \int \frac{d}{dx}[x^{n+1}] e^x dx \quad \leftarrow \text{by Int. by parts}$$

$$= x^{n+1} e^x - \int (n+1) x^n e^x dx$$

$$= x^{n+1} e^x - (n+1) \int x^n e^x dx$$

$\leftarrow$ by Conj.

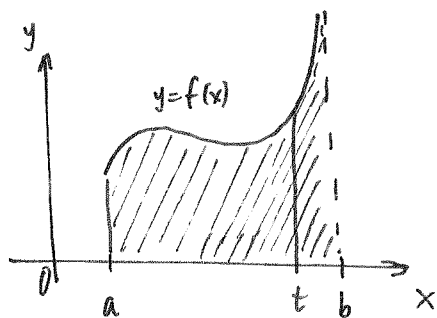

$$= x^{n+1} e^x - (n+1) e^x \left(x^n - \frac{d}{dx}(x^n) + \frac{d^2}{dx^2}(x^n) - + \dots - n! \right) + C$$

$$= x^{n+1} e^x - e^x \left[(n+1)x^n - (n+1)\frac{d}{dx}(x^n) + (n+1)\frac{d^2}{dx^2}(x^n) - + \dots - (n+1)n! \right] + C$$

$$= e^x \left[x^{n+1} - \frac{d}{dx}[x^{n+1}] + \frac{d^2}{dx^2}[x^{n+1}] - \frac{d^3}{dx^3}[x^{n+1}] + \dots - (n+1)! \right] + C$$

$\square$

Case II. Discontinuous Integrands

If $\int_a^t f(x) dx$ exists for all $t \in (a, b)$, then

$$\boxed{\int_a^b f(x) dx = \lim_{t \rightarrow b^-} \int_a^t f(x) dx}$$

also left limits
(from the right)

Ex. $\int_2^5 \frac{1}{\sqrt{x-2}} dx = \lim_{t \rightarrow 2^+} \int_t^5 \frac{1}{\sqrt{x-2}} dx$

$$\begin{array}{ll} u = x-2 & u(t) = t-2 \\ du = dx & u(5) = 3 \end{array}$$

$$= \lim_{t \rightarrow 2^+} \int_{t-2}^3 u^{-1/2} du$$

$$\begin{array}{l} \text{let } s = t-2 \\ \text{so } s \rightarrow 0^+ \text{ as } t \rightarrow 2^+ \end{array}$$

$$= \lim_{s \rightarrow 0^+} \left[2u^{1/2} \right]_{t-2}^3$$

$$= \lim_{s \rightarrow 0^+} [2\sqrt{3} - 2\sqrt{s}]$$

$$= 2\sqrt{3} - 0 = \boxed{2\sqrt{3}}$$

Ex. $\int_0^{\pi/2} \sec x dx$

$\sec \frac{\pi}{2}$ is undefined.

$$= \lim_{t \rightarrow \frac{\pi}{2}^-} \int_0^t \sec x dx = \lim_{t \rightarrow \frac{\pi}{2}^-} \left[\ln |\sec x + \tan x| \right]_0^t$$

$$= \lim_{t \rightarrow \frac{\pi}{2}^-} \left[\ln |\sec t + \tan t| - \underbrace{\ln |\sec 0 + \tan 0|}_{= \ln 1 = 0} \right]$$

$$= \ln \left| \lim_{t \rightarrow \frac{\pi}{2}^-} \sec t + \lim_{t \rightarrow \frac{\pi}{2}^-} \tan t \right| = \infty \Rightarrow \underline{\text{diverges}}$$

$$\begin{aligned}
 \text{Ex. } \int_0^3 \frac{dx}{x-1} &= \int_0^1 \frac{dx}{x-1} + \int_1^3 \frac{dx}{x-1} \\
 &= \lim_{t \rightarrow 1^-} \left[\ln|x-1| \right]_0^t + \lim_{t \rightarrow 1^+} \left[\ln|x-1| \right]_t^3 \\
 &= \underbrace{0 - \ln 0}_{+\infty} + \underbrace{\ln 2 - \ln 0}_{+\infty}
 \end{aligned}$$

each piece diverges, so the whole diverges.

9/10/12

The Comparison Theorem.

Suppose the f and g are continuous functions with
 $f(x) \geq g(x) \geq 0$ for $x \geq a$

a) If $\int_a^\infty f(x) dx$ is convergent, then so is $\int_a^\infty g(x) dx$

b) If $\int_a^\infty g(x) dx$ is divergent, then so is $\int_a^\infty f(x) dx$.

$$\text{Ex. } \int_0^\infty e^{-x^2} dx = \underbrace{\int_0^1 e^{-x^2} dx}_{\text{convergent}} + \int_1^\infty e^{-x^2} dx$$

$e^{-x^2} \leq e^{-x}$ for all $x \geq 1$.

$$\begin{aligned}
 \int_1^\infty e^{-x} dx &= \lim_{t \rightarrow \infty} \int_1^t e^{-x} dx = \lim_{t \rightarrow \infty} -e^{-x} \Big|_1^t = \lim_{t \rightarrow \infty} -\frac{1}{e^t} + \frac{1}{e} \\
 &= \boxed{\frac{1}{e}}
 \end{aligned}$$

By comparison then: $\int_1^\infty e^{-x^2} dx \leq \frac{1}{e}$ converges.

Using Complex analysis, one can show:

$$\int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$$

Ex. $\int_1^{\infty} \frac{1+e^{-x}}{x} dx$ diverges because $\int_1^{\infty} \frac{1}{x} dx$ diverges.

Ex. $\int_1^{\infty} \frac{dx}{x+e^{2x}}$. $x + e^{2x} > e^{2x}$ if $x \geq 1$

$$\text{So } \frac{1}{x+e^{2x}} < \frac{1}{e^{2x}}$$

and $\int_1^{\infty} \frac{dx}{x+e^{2x}} < \int_1^{\infty} \frac{1}{e^{2x}} dx$ which is convergent.
